

EXPERIMENT-02

AIM

To write a Python program using NumPy to find the average price of all products sold in the past month using a 3×3 matrix where each row represents sales of a different product.

ALGORITHM

1. Start the program.
2. Import the NumPy library.
3. Create a 3×3 NumPy array containing sales prices of products.
4. Use `np.mean()` to compute the average price of all values in the matrix.
5. Print the average price.
6. End the program.

PROGRAM

```
import numpy as np
# 3x3 matrix (each row = product sales data)
sales_data = np.array([
    [120, 150, 130],
    [200, 180, 170],
    [90, 110, 95]
])
avg_price = np.mean(sales_data)
print("Average price of all products:", avg_price)
```

SAMPLE INPUT

```
[  
  [120, 150, 130],  
  [200, 180, 170],  
  [90, 110, 95]  
]
```

SAMPLE OUTPUT

Average price of all products: 138.33

RESULT

The program successfully calculated the overall average price of all products sold in the past month using NumPy.
